Detector induced assymetry in CP violation measurements

Eugenia Spedicato, Lina Maria Ortiz Parra, Jonah Blank

February 12, 2020

Comments - efficiencies

- very small errors in $D = \frac{\epsilon_+ - \epsilon_-}{\epsilon_+ + \epsilon_-}$
  $\rightarrow D = 0$ out of 5σ-range
- smaller error for *UP*-polarity due to higher statistics
- no difference between *UP* and *DOWN* within scope of the error
- in the MC: $\epsilon_{D^*} = 0$(`Dst_reconstructed` always 0)
  in our computation: $\epsilon_{D^*} = \epsilon_{\pi,s} \cdot \epsilon_{D^0}$

Comments - plots

- structure of $\epsilon(\phi)$ probably due to rectangular detector shape
- peak in $\epsilon_{D^*}(\theta)$ within scope of error
