

# Detector induced assymetry in CP violation measurements

- very small errors in  $D = \frac{\epsilon_+ - \epsilon_-}{\epsilon_+ + \epsilon_-}$   
→  $D = 0$  out of  $5\sigma$ -range
- $D$  is much smaller in for the *UP*-polarity
- smaller error for *UP* due to higher statistics
- no difference in the efficiencies between *UP* and *DOWN* within scope of the error
- in the MC:  $\epsilon_{D^*} = 0$  (Dst\_reconstructed always 0)  
in our computation:  $\epsilon_{D^*} = \epsilon_{\pi,S} \cdot \epsilon_{D^0}$

- structure of  $\epsilon(\phi)$  probably due to rectangular detector shape
- peak in  $\epsilon_{D^*}(\theta)$  within scope of error

Table: The asymmetry  $\frac{N_+ - N_-}{N_+ + N_-} / 10^{-3}$

Polarity	$\pi$	$K$	$soft\pi$	$D^0$	$D^*$
<i>UP</i>	$-0.1 \pm 0.4$	$4.7 \pm 0.4$	$-3.8 \pm 0.5$	$-4.7 \pm 0.5$	$-8.2 \pm 0.5$
<i>DOWN</i>	$-0.3 \pm 0.4$	$5.2 \pm 0.4$	$3.7 \pm 0.5$	$-5.0 \pm 0.5$	$-0.8 \pm 0.5$

- interesting:  $D_{soft\pi}$  &  $D_{D^0}$  cancel partially in *DOWN*,  
but add up in *UP*

# Comparison of different charges with $UP$ polarity - $D^*$

# Comparison of different charges with *DOWN* polarity - $D^*$

# Comparison - $D^*\phi$

# $D^*$ asymmetry dependencies - $UP$ polarity

# $D^*$ asymmetry dependencies - *DOWN* polarity

# $D^*$ asymmetry - $\phi$

- left *UP*, right *DOWN*
- clear dependency in  $\phi$ , inverted *UP*  $\leftrightarrow$  *DOWN*
- doesn't seem to have dependency on other topological variables  
→ form of the detector is biggest source of induced CPV

# $D^*$ asymmetry UP+DOWN
